

## Yesterday's stuff

### Inbuilt Node.js

- FS
- CP - child-process.
- OS
- Path

## Today's Stuff.

- 1) Path modules
- 2) Importing Exporting (create own modules & import/export)
- 3) npm - node package manager (similar to play store)  
↳ allows downloading external modules
- 4) File System Organizer (Project) 2 to 3 classes. {NOT TODAY}

\* To create you should know X  
Create and then know ✓

### CLI Resume.

#### ① Path Module

- dirname() gives extension
- basename() gives name of actual file or directory
- dirname gives path of current directory
- filename gives path of current file.

② Creating Own Modules & Exporting  
make a js file and add methods to it

then use `module`, `export` to export methods. as  
objects

In JS objects are key value pairs

to import from same folder: use `'./filename'`

This helps us make modular code

③ To install external modules

`npm install <module name>`

★ Command Line Resume

No need to know everything  
Do & learn
